

## **Ready-to-use for Temmel in Elsendorf**

The division General Contracting of the Unger Group realized another follow-up commission from regular client TLC Temmel Logistik Center GmbH in Germany: The project comprised the restoration and conversion of an existing building into a production facility for car parts including approval planning on a developed area of approximately 10,100 sqm. TLC Temmel purchased a former industrial building in Elsendorf, which was adapted by the Unger Steel Group within eight months for the purpose of assembling car parts; the existing building was extended by two structures, which serve to load and offload trucks. This project was handed over to the client in June 2014.

In the future, car components will be produced at the plant for Magna corporation. All renovation and conversion works were performed simultaneously with the establishment of the production lines inside the existing hall.
